Five 90-minute meetings. Four projects. One final presentation. Beginners start from a working application, inspect its evidence, make one change, and show the result.

Start here

1. Open Preparation. Choose Windows or Mac, then one coding assistant and one answer engine. This catches account and installation problems before class.

2. Open Level 1. Follow its numbered steps. Each names the action, reason, expected result, and recovery route.

3. Keep the manual edit card and saved examples available offline.

4. Sign in to the course before class and confirm you can open Level 1's upload form.

Run the document helper

From this repository's root, after installing uv:

```
uv sync --frozen
uv run --frozen zta setup
uv run --frozen zta doctor documents
uv run --frozen zta start documents
```

Open http://127.0.0.1:8501. Keep the terminal open. Stop with Ctrl+C. Python and package versions come from the included lockfile. The app does not install a cloud key or model for you; model setup explains both paths.

Course map

Level	Project	Proof
1 - Your Documents Answer Back	Document helper	Five tests, source checks, change, private submission
2 - The Night Watchman	Page watcher	Baseline, unchanged, changed, off switch
3 - Nothing Leaves the Building	Local model lab	Observed offline result or labeled fallback, six rows, named-rule retest
4 - The Front Desk, Attacked and Locked	Local front desk	Five callers, one edit, fixed attacks, four defenses, log and pause
5 - Choose, Improve, and Present	An earlier project	Improved outcome, cost, presentation

Level 2 now has a maintained watcher and full preparation guide. Levels 3 and 4 have maintained local labs and full preparation guides; both reuse earlier setup. Level 5 has a full preparation guide, eight-item proof board, project-specific final checks, worked cost sheet, and labeled presentation fallback. The alternative-project catalog remains on the course website; it is not a second required course.

Downloads and status

Download the versioned learner and instructor ZIP files from Releases. Each includes PDFs and offline instructions. Learner code comes from your fork; a materials ZIP is not a Git working copy.

The published Level 1 package remains **v1.0.0-rc.1**. The current Level 5 work is a local **v1.4.0-rc.1 review candidate**, including Levels 1-4; see Level 5 verification. Use its matching complete course checkout, not an older download. A merge does not publish the tag or its downloads. Earlier classroom gates remain in their verification records.

What goes where

- `courses/project-lab/`: canonical five-level teaching source and generated handouts.

- `preparation/`: shared installation, account, model, and recovery guides.

- `projects/documents/`: the custom app, editable settings, and deterministic tests.

- `projects/watchman/`: the scheduled watcher, local rehearsal, workflow template, and tests.

- `.zta/`: private credentials, imported files, search index, and evidence. Git ignores it.

- `scripts/`: course builds, validation, releases, and export to the website or private platform.

Never put keys, private documents, learner evidence, or private platform source in this public repository. The app is a local single-user teaching tool. It has no public-host authentication layer.

Maintain and publish

Run `uv run --frozen zta test documents`, `uv run --frozen zta test watchman`, and `uv run --frozen python scripts/validate_materials.py`. Build PDFs and slides with the commands in Maintaining the course. Commit a reviewed branch; merges and live deployments are separate actions.

Questions and access blocks: hello@celayasolutions.com. Share the command and error category, never an API key or private file. Code inherited from the existing course retains its MIT notice in LICENSE; third-party applications and model weights retain their own licenses. New course documents carry the required Celaya Solutions header.
