Course nickname: _____ **Date:** _____

Route: ☐ Own fork hosted ☐ Local rehearsal ☐ Partner ☐ Saved example ☐ Paper

Fork URL: _____ **Default branch:** _____

Course candidate commit: _____ **Computer / OS:** _____

Preparation minutes: ____ **Class start/end:** ____ Assistant: Claude Code / Codex / Manual

Work in the copy at .zta/PROJECT-LAB-02.md. Save after each prediction and result. Do not commit it. Use Not performed or Blocked: reason for missing live fields. Saved examples are not live output.

Goal and pass check

A complete watchman spec; baseline, unchanged, and changed runs; one useful alert and log trail; a never list; and proof that the learner used the off switch.

- ☐ Spec checked before enabling
- ☐ Predictions saved before all four runs
- ☐ Three main receipts and honest verdicts
- ☐ One issue with old/new values; repeat does not duplicate it
- ☐ Switch used and refreshed disabled state checked
- ☐ Private file submitted and reopened, or access block named

Safety check / Verificación de seguridad

- ☐ Own public learner fork; supplied page only
- ☐ No private page, login bypass, person tracking, or aggressive polling
- ☐ No token in code, screenshots, prompts, or receipts
- ☐ Practice issue allowed only in this fork; no posting elsewhere
- ☐ No purchase, reply, deletion, or automatic spending
- ☐ Vigilo solamente mi página de práctica y dejo el flujo desactivado.

Task 1 - Six-line spec

1. Address (raw page in my fork):
2. Signal (exact marked element):
3. Meaningful-change rule (valid values and direction):
4. Trigger (manual/daily time with zone; off after class):

5. Alert (where, old/new fields, one per transition):

6. Never list (include the allowed practice-issue exception):

Partner's prediction of when an issue appears:

One line I clarified before enabling:

Task 2 - Predict, then run

Run A - Baseline

Prediction written at (time/zone):

Expected value, decision, new issue count:

Actual time / previous / current / decision:

Run URL and source commit:

State current / pending after the run:

Receipt file or copied safe receipt line:

Verdict: Pass / Miss / Blocked. Why:

Run B - Unchanged

Prediction written at (time/zone):

Expected value, decision, new issue count:

Actual time / previous / current / decision:

Run URL and source commit:

Receipt file or copied safe receipt line:

Verdict: Pass / Miss / Blocked. Why:

Run C - OPEN to PAUSED

Prediction written at (time/zone):

Expected value, decision, new issue count:

Page-edit commit URL:

Actual time / previous / current / decision:

Run URL and source commit:

Receipt file or copied safe receipt line:

Issue URL, title, old value, new value, and source:

State current / pending after the run:

Verdict: Pass / Miss / Blocked. Why:

Run D - Repeat PAUSED

Prediction written at (time/zone):

Expected decision and number of additional issues:

Run URL, actual decision, issue count before/after:

Verdict: Pass / Miss / Blocked. Why:

One failure I can explain

Live observed / authored saved example:

Safe error category, date, and stage:

Last good state before/after:

Why this is not no change:

Next bounded recovery step:

Optional footer exercise: before receipt / one edit / after receipt / explanation:

Task 3 - Off switch

Prediction before disabling (time and what should become unavailable):

Fork and workflow name:

Who owns the switch:

Disable action used and time/zone:

WATCHMAN_ENABLED now equals:

Queued/active runs before stopping:

Cancel actions and final run states, or None:

What I tried after refreshing without re-enabling:

Observed banner and unavailable control:

New runs created by this attempt:

What I actually proved:

Scheduled behavior I have not observed:

Final state left for after class:

Partner evidence check

Partner nickname/initials (optional):

- ☐ Predictions match the written rule
- ☐ Baseline, unchanged, changed, and failed are distinguished
- ☐ Issue names OPEN and PAUSED; repeat is quiet
- ☐ Switch was used; outstanding work was checked
- ☐ Evidence route is honest and private notes are excluded from Git

One revision requested and what I changed:

Proof

Final learner code/page commit URL:

Evidence filename: PROJECT-LAB-02.md

Course Level 2 assessment opened:

Upload time and receipt (keep enrollment details private):

Reopened file matches nickname, last run, and stop evidence: Yes / No / Blocked

Missing live checks or submission block:

Exit ticket

1. Where does the job run while my laptop is closed?
2. Why is failed different from no change?
3. What does the saved state let the next runner do?
4. What may the token do, and what does this code actually do?
5. Why start a new workflow after a page edit?
6. What did my off-switch test prove and what did I not observe?

My interruptor / My switch is:

Optional Railway plan: start / environment / health / state / persistence / schedule owner / stop / dated cost source. Planning only; no deployment.
