Run from the course root, where `pyproject.toml` lives. Mac Terminal and Windows PowerShell use the same commands. Use `uv sync --frozen` online before class. Do not type square-bracket placeholders.

| Command                                                 | What it does                                                   | Expected result                                                      |
|---------------------------------------------------------|----------------------------------------------------------------|----------------------------------------------------------------------|
| <code>ollama list</code>                                | Lists already downloaded models                                | <code>gemma3:1b</code> and <code>gemma3:4b</code> with IDs and sizes |
| <code>uv run --frozen zta prepare local-models</code>   | Copies the worksheet and rules without replacing existing work | Files in private <code>.zta/local-models/</code>                     |
| <code>uv run --frozen zta doctor local-models</code>    | Checks the fixed local endpoint and both models                | Two LOCAL rows; no answer generated                                  |
| <code>uv run --frozen zta offline local-models</code>   | Runs one supplied prompt                                       | Answer, total seconds, receipt; human observes disconnection         |
| <code>uv run --frozen zta benchmark local-models</code> | Runs the same three prompts on both models                     | Six rows; you score quality                                          |
| <code>uv run --frozen zta create local-models</code>    | Creates/replaces the course name from your private rules       | <code>zta-desk:latest</code> appears in <code>ollama list</code>     |
| <code>uv run --frozen zta check local-models</code>     | Tests normal writing and missing price/date                    | Two actual answers for your verdict                                  |
| <code>uv run --frozen zta test local-models</code>      | Runs code checks without a model request                       | Passing tests; not model-quality proof                               |

Need to stop? Press `Ctrl+C`. On your own machine run `ollama stop gemma3:1b`, `ollama stop gemma3:4b`, or `ollama stop zta-desk:latest` for the course model still loaded. Unloading keeps its files. Avoid deleting models as a classroom shortcut.

[Preparation](#) includes exact downloads, hardware planning, sources, and recovery. [Manual edit](#) shows the one-rule change. [Ollama Modelfile reference](#) explains FROM, SYSTEM, and PARAMETER.
