Start with [Preparation](#). Keep one copy of this guide open until the app runs.

Step / where	Action	Why	Expected result	Recovery
1 / settings	Apple menu > About This Mac: record chip and memory. System Settings > General > Storage: record free space. Current Ollama requires macOS 14 or newer.	Checks the planned local-model target	Record OS, RAM, chip, and storage	Cloud generation reduces model hardware needs; installation still requires an unrestricted computer
2 / browser and installer	Install GitHub Desktop , choose the installer matching your OS/chip, open it, and sign in	Manages your fork and changes	Correct GitHub username appears	Complete the browser authorization, then return to Desktop
3 / terminal	Press Command+Space, type Terminal, and press Return.	Opens the command tool	A prompt is visible	Ask the helper to point to the app; keep control of the keyboard
4 / terminal	Run the installer below; wait for completion; close and reopen the terminal	Installs uv and refreshes PATH	uv --version prints a version	If blocked by device policy, use the setup clinic; do not change machine-wide policy
5 / clone folder	In GitHub Desktop choose Repository > Show in Finder. Open Terminal. Type cd (including the space), drag the cloned folder from Finder into Terminal, then press Return. Run pwd and ls.	Places commands at the repository root	Listing includes pyproject.toml and uv.lock	If they are missing, open the clone itself, not its parent or projects subfolder
6 / same terminal	Run uv sync --frozen	Downloads managed Python and installs the release's packages	No error; local .venv exists	Check internet, storage, and permissions. Keep uv.lock unchanged
7 / browser and terminal	Complete model setup and coding-assistant setup	Configures the selected routes	Doctor passes and assistant can inspect README	Follow Recovery
8 / same terminal	Run uv run --frozen zta start documents, then open http://127.0.0.1:8501	Starts the local interface	Start, Binder, Five questions, Improve, and Proof tabs appear	Keep the terminal open; check its error if the page fails
9 / terminal	Press Ctrl+C; refresh the browser	Demonstrates the stop	Browser disconnects; the terminal prompt returns	Closing only the browser does not stop the app

uv installer

```
curl -LsSf https://astral.sh/uv/install.sh | sh
```

Reopen the terminal, then run:

```
uv --version
uv sync --frozen
uv run --frozen zta setup
uv run --frozen zta doctor documents
uv run --frozen zta start documents
```

Run each line separately; read its result before continuing. Installer source: [official uv instructions](#). Ollama requirements: [official Mac guide](#).

Command not found

If a newly installed command is missing, completely close and reopen the terminal, then try its `--version` check again. If it still fails, use the [official installer troubleshooting](#) and the setup clinic. Do not paste random fixes or private account information into chat.

Visual guide

[Open the illustrated setup map](#). It distinguishes the browser, GitHub Desktop, terminal, and local app. It is an instructional diagram, not a screenshot claiming a device pilot occurred.
