Start with [Preparation](#). Keep one copy of this guide open until the app runs.

Step / where	Action	Why	Expected result	Recovery
1 / settings	Start > Settings > System > About: record Windows version, System type, and Installed RAM. File Explorer > This PC: record free disk space. Use Windows 10 22H2 or newer on a supported 64-bit computer.	Checks the planned local-model target	Record OS, RAM, chip, and storage	Cloud generation reduces model hardware needs; installation still requires an unrestricted computer
2 / browser and installer	Install GitHub Desktop , choose the installer matching your OS/chip, open it, and sign in	Manages your fork and changes	Correct GitHub username appears	Complete the browser authorization, then return to Desktop
3 / terminal	Open Start, type PowerShell, and open Windows PowerShell. Use PowerShell, not Command Prompt.	Opens the command tool	A prompt is visible	Ask the helper to point to the app; keep control of the keyboard
4 / terminal	Run the installer below; wait for completion; close and reopen the terminal	Installs uv and refreshes PATH	uv --version prints a version	If blocked by device policy, use the setup clinic; do not change machine-wide policy
5 / clone folder	In GitHub Desktop choose Repository > Show in Explorer. In File Explorer, click the address bar, type powershell, and press Enter. Run Get-Location and Get-ChildItem.	Places commands at the repository root	Listing includes pyproject.toml and uv.lock	If they are missing, open the clone itself, not its parent or projects subfolder
6 / same terminal	Run uv sync --frozen	Downloads managed Python and installs the release's packages	No error; local .venv exists	Check internet, storage, and permissions. Keep uv.lock unchanged
7 / browser and terminal	Complete model setup and coding-assistant setup	Configures the selected routes	Doctor passes and assistant can inspect README	Follow Recovery
8 / same terminal	Run uv run --frozen zta start documents, then open http://127.0.0.1:8501	Starts the local interface	Start, Binder, Five questions, Improve, and Proof tabs appear	Keep the terminal open; check its error if the page fails

Step / where	Action	Why	Expected result	Recovery
9 / terminal	Press Ctrl+C; refresh the browser	Demonstrates the stop	Browser disconnects; the terminal prompt returns	Closing only the browser does not stop the app

uv installer

`powershell -ExecutionPolicy Bypass -c "irm https://astral.sh/uv/install.ps1 | iex"`

Reopen the terminal, then run:

```
uv --version
uv sync --frozen
uv run --frozen zta setup
uv run --frozen zta doctor documents
uv run --frozen zta start documents
```

Run each line separately; read its result before continuing. Installer source: [official uv instructions](#). Ollama requirements: [official Windows guide](#).

Command not found

If a newly installed command is missing, completely close and reopen the terminal, then try its `--version` check again. If it still fails, use the [official installer troubleshooting](#) and the setup clinic. Do not paste random fixes or private account information into chat.

Visual guide

[Open the illustrated setup map](#). It distinguishes the browser, GitHub Desktop, terminal, and local app. It is an instructional diagram, not a screenshot claiming a device pilot occurred.
