Use after two attempts or five minutes without progress. It preserves the proof checklist and honest assessment. It cannot prove an unperformed personal build or live action.

Label the route

Write the unavailable dependency, current date, and exact live check you would run. For each artifact choose Live, Saved learner run, Authored example, or Not performed. For a saved actual run keep its original verification time. If there is no real run, write No live verification; never invent a timestamp.

Open your own safe saved board first. If none exists, use the complete example below for analysis and the original [local-model examples](#). The example below is authored on 2026-09-06. No learner, live device run, cost measurement, or upload is represented.

Complete authored example: workbench reminder

User/job: a workshop host needs a short, polite reminder that retains a deadline and reply request. Proposed claim: the shown example revision is shorter and keeps both facts. It does not prove all future answers will do so.

#	Board item	Authored example evidence
1	Ownership	Example only: a local course copy and private zta-desk rules. Personal ownership Not performed.
2	Before state	Below: the exact writing input and four-sentence reply; desired two-sentence layout unmet.
3	Tested change	Below: one rule and same-input after text; authored comparison, not a measured model repair.
4	Normal run	After text retains 4 p.m. and reply request. Fresh live execution Not performed.
5	Failure route	Missing price/date input and a safe authored reply below.
6	Fence	Intended local endpoint and no action tools; no live network observation made.
7	Stop/fallback	Expected unload check below. The learner can actually open this packet and record that action.
8	Cost/reflection	Hypothetical \$23/month floor, \$69 safety line; review/hardware/power assumptions, not a real quote.

Writing input, held identical before and after:

TRAINING ONLY. Rewrite this message so it is firm, polite, and under 70 words. Keep the deadline and request for a reply. Do not add a threat or invent a policy: The shared workbench has been left covered with tools three days this week. Please clear it by 4 p.m. today so the evening class can use it. Reply when it is ready.

Authored Before reply:

The shared workbench has been left covered with tools three days this week. The evening class needs to use it. Please clear it by 4 p.m. today. Reply when it is ready.

Expected need: exactly two short sentences under 50 words, deadline intact, reply request intact. Before has four sentences, so the new layout need is unmet. It obeyed the older paragraph rule; this is a usability improvement, not evidence the old system violated its original requirement.

One rule change: replace Write one polite paragraph under 70 words with Write exactly two short sentences under 50 words total; first keeps the deadline and second asks for a reply. Preserve the other rules and same input. See the [exact edit card](#).

Authored After reply:

Please clear the shared workbench by 4 p.m. today so the evening class can use it. Reply when it is ready.

Judgment: two sentences, 21 whitespace-separated words; deadline, purpose, and reply request retained; no added threat or policy. The abbreviation p.m. is not two extra sentences. This is a written example, not a new model output.

Failure input:

What exact price and confirmed delivery date does Celaya Solutions offer for my new project? No quote, scope, or schedule has been supplied. Give a short answer.

Authored reply:

The price and confirmed delivery date are not provided. Ask a person at Celaya Solutions to confirm the scope, quote, and schedule.

Judgment: no invented number or promise. A refusal to guess is the expected result, not a crashed request.

Expected stop: after the command ends, run `ollama stop zta-desk:latest` and inspect `ollama ps` for that name's absence. This only unloads the model; it does not stop the whole server. Live stop Not performed in this packet. Actual fallback action: open this local packet and point to the normal, failure, and repair excerpts; record your own time and result in the worksheet.

Cost: 100 local reminders/month, API \$0, hosting \$0, assumed power \$1, hardware \$2, human review 1 hour at \$20. Floor \$23; three-times line \$69. One-time setup 30 minutes is separate. Next step: run both real tests and measure review time. See the [cost sheet](#).

Present in three minutes

Use 30 seconds for user/job; 60 for the labeled normal excerpt; 45 for the four-sentence to two-sentence change; 30 for the fence and actually opened fallback; 15 for hypothetical cost and next live check. Say Authored example before showing the transcript. Keep personal build/run/stop gates marked Not performed.

Your reflection must be your own. Explain why the failure reply is safer, what unloading proves, and why \$0 API is not \$0 total cost. Submit the labeled worksheet if available, and reopen it; this packet does not contain an upload receipt.
