Finish before class; allow 15-25 minutes and record your actual time. Use your own prepared Windows or Mac computer, your earlier course fork, and the complete instructor-reviewed Level 5 copy. The public v1.0.0-rc.1 download does not contain this full pack. The current candidate must be published or supplied by the instructor before learners can fetch it.

## 1. Confirm the folder and project

Where: GitHub Desktop. Open the course repository; use Repository > Show in Finder or Show in Explorer. Confirm the folder contains `pyproject.toml` and `courses/project-lab/level-05/preparation.md`. Keep existing changes; ask for help if the reviewed update conflicts. Never discard earlier work to install this level.

Choose Documents, Watchman, Local Model, or Front Desk. Open that level's worksheet and one before/after pair privately. Write the user and job. You may use an earlier repair; do not unlock or reset a project to manufacture a new before state.

Why: class time goes to proof and presentation. Expected: one working choice and known evidence locations. Recovery: use the [project paths](#) and label missing evidence before class.

## 2. Check existing tools

Open a terminal at the course root using your [Mac](#) or [Windows](#) guide. Run `uv sync --frozen` online before class. Then run only your chosen project's doctor and tests listed in the project paths. They use your existing setup. A doctor pass or code-test pass is not a new user-result receipt.

No new model, billing plan, paid assistant, or hosting account is required. Front Desk and Local Model need their earlier local models available. Watchman may use the local rehearsal with hosted limitations labeled. Recovery: after two attempts or five minutes, use the saved route. Do not enable a hosted workflow just to obtain a capstone screenshot.

## 3. Make a private worksheet copy

Where: file manager and your existing plain-text editor. In the course root, show hidden files if needed: Finder Shift+Command+Period; Windows Explorer View > Show > Hidden items. Open or create `.zta`, then create its showcase folder. Copy `courses/project-lab/level-05/worksheet.md` into that folder and rename only the copy to `PROJECT-LAB-05.md`. Preserve the `.md` extension; avoid `.md.txt`. If that file already exists, keep and continue it rather than replacing it.

Expected: `.zta/showcase/PROJECT-LAB-05.md` opens in your editor. Fill name or course nickname and date. Save, close, and reopen it to check the file. The template stays blank. Use paper if your editor is unavailable, then follow the instructor's private hand-in route.

GitHub Desktop Changes must not show the private worksheet. Both `.zta/` and `PROJECT-LAB-05.md` are ignored. If private work appears there, stop and move it back to the private folder; do not weaken ignore rules or push it. There is no `zta start` showcase command: this is a workbook around your existing project.

## 4. Gather and rehearse safely

Keep eight safe excerpts using the [proof-board card](#). Put all content needed for grading in the worksheet; a local path alone cannot be opened by the instructor. Do not copy keys, billing identities, or private source material. Retain original receipts privately.

Open the [cost sheet](#), [presentation card](#), and [outage packet](#). Download or print them before class. Test that the saved packet opens with networking unavailable; do not disconnect if that would interrupt a remote or assistive session. Record what you actually observed.

Expected: you can find each item in under a minute, and the fallback opens locally. Recovery: put safe excerpts in the worksheet or print them. The PDF source links may require the published candidate tag and network; the complete local course copy is the offline route.

## 5. Check course access

Privately open [the course sign-in](#). Check access to Level 5 without creating a dummy submission. If the level is unavailable, tell the instructor and keep local work. Upload and reopen only your completed worksheet at the end of class. Access and upload are separate from running a project.

List before class: chosen project, one user/job, earlier repair evidence, prepared computer, private worksheet, safe fallback, and any access block. Bring these to class; no new purchases are needed.
