Choose one assistant. It edits the course app; it is separate from the engine that answers document questions. Account access and usage limits vary. Check the linked official account information before buying anything. If unavailable, use the manual edit card and keep the same evidence requirements.

Claude Code

Where	Action	Why	Expected result	Recovery
Browser	Open official quickstart and confirm your account has Claude Code access	Prevents assuming a free chat login includes coding access	You know which account you will sign into	Use manual card if account access is unavailable
Mac Terminal	Run <code>curl -fsSL https://claude.ai/install.sh bash</code>	Installs the official native tool	Installation finishes	Use the official troubleshooting page if policy/network blocks it
Windows PowerShell	Run <code>irm https://claude.ai/install.ps1 iex</code>	Installs the Windows native tool	Installation finishes	Use PowerShell; a Command Prompt window does not recognize irm
Reopened terminal	Run <code>claude --version</code>	Confirms the shell can find it	Claude Code version appears	Reopen terminal; follow official PATH recovery
Course root terminal	Run <code>claude</code> ; follow the browser sign-in and return to the terminal	Attaches coding access to your project	You can send a prompt	Do not paste login codes or credentials into course evidence
Assistant	Send the inspection prompt below	Checks the project boundary before editing	Explanation only, no file changes	Reject edits and restate the read-only request

Codex

Where	Action	Why	Expected result	Recovery
Browser	Open official desktop setup ; choose the download for your OS/chip	Uses the supported installation route	The app installs and opens	Check official OS requirements if the installer refuses
Desktop app	Sign into your ChatGPT account and choose Codex	Opens the coding workspace	Codex task controls appear	Resolve account access or use the manual card
Project selector	Open the local course clone folder; select local work for this lesson	Keeps edits in the learner's fork	README and project folder belong to your clone	Remove an incorrectly selected folder and choose the right clone
Task	Send the inspection prompt below	Confirms what the assistant will edit	Explanation only	Reject unrelated edits; do not enable unattended publishing

First prompt - inspect only

Read AGENTS.md, the course README, and projects/documents/README.md. Explain how the document helper runs and where I can change retrieval settings. Do not edit files, read .zta/, install software, send requests, or publish anything.

Guided-edit prompt

Read the Level 1 instructions and inspect my recorded miss. Explain its likely cause before editing. Change one rule or retrieval setting that addresses it. Preserve the supplied documents, expected results, and tests. Show the change, explain why it should help, and tell me how to rerun the same question. Do not publish anything.

Add your question, expected behavior, observed answer, and safe source excerpts. Never attach .zta/config.json. Read the diff before accepting it. Run the course checks after the edit. Use GitHub Desktop yourself to review and publish to your own fork.

If you used a coding assistant to make an edit, record its name in the app's Start tab. If you used the [manual card](#), record Manual card.

After editing Python rules

Settings-only edits take effect after saving and refreshing the browser. If the edit changes a .py file, return to the app's terminal, press Ctrl+C, run `uv run --frozen zta start documents` again, and refresh the browser before rerunning the same question. This starts the changed code. Your saved expectations and runs remain in .zta/. If a stale-import error appears, use this same restart sequence; do not delete progress or reinstall packages.
