Use this card with Claude Code, Codex, or a plain-text editor. The learner owns the change and judgment.

Where	Action	Why	Expected result	Recovery
GitHub Desktop	Confirm the current repository is YOUR fork. Choose Current branch > New branch, name it codex/level-01, create it, and publish the branch to your fork	Keeps the class edit separate from the starting version	Branch name and your fork owner are visible	Switch back if you opened the course owner's repository
Finder/Explorer	Open projects > documents > settings.toml using a text editor	This is the small learner-editable configuration	You see max_passages and show_source_quotes	On Mac use TextEdit in plain-text mode; on Windows use Notepad; preserve .toml extension
Editor	For a controlled miss, replace only max_passages = 4 with max_passages = 1; save	Hides some evidence in a measurable way	File contains one passage setting	If format error appears, restore the exact original line
Browser	Refresh the app; confirm sidebar shows 1 passage; rerun question 5; inspect retrieved records	Tests the changed evidence window	Only one passage is available	If sidebar still shows 4, save the file in the correct clone and refresh
Editor and browser	Restore max_passages = 4; save, refresh, rerun question 5	Repairs evidence coverage	Both training records can appear	Compare actual retrieved passages rather than demanding one model wording
Editor	Change show_source_quotes = false to show_source_quotes = true; save	Leaves a useful visible improvement to commit	Supporting quotes will appear below answers	Use lowercase true without quotation marks
Browser	Refresh; rerun the same question; save Before and After in Improve	Records the effect	Same question with visible source quotes	Choose the correct runs by time and ID
Terminal at course root	uv run --frozen zta test documents	Checks application behavior without paid model calls	All deterministic tests pass	Record any failure and ask for help; do not weaken the tests
GitHub Desktop	Inspect Changes. Select only the intended project edit. Ensure max_passages is 4 and show_source_quotes is true	Keeps experiments and private files out of the commit	Small settings diff; no .zta or evidence	If .zta appears, stop and fix ignore rules before publishing

Where	Action	Why	Expected result	Recovery
GitHub Desktop	Enter summary Show source quotes for Level 1. Click Commit to codex/level-01, then Push origin	Saves the improvement to your own account	Desktop reports no outgoing commits	Complete account authentication if requested
Desktop History	Select the new commit; use View on GitHub from its menu; copy the browser URL. Copy your fork's main repository URL too	Provides exact ownership and version receipts	URLs go into Proof fields	Verify owner is your username before submitting

Do not open a pull request into the instructor's repository for routine homework. Do not merge your branch during the lesson. Your commit URL is the handoff. Never commit PROJECT-LAB-01.md or anything inside .zta/.

After editing Python rules

Settings-only edits take effect after saving and refreshing the browser. If the edit changes a .py file, return to the app's terminal, press Ctrl+C, run `uv run --frozen zta start documents` again, and refresh the browser before rerunning the same question. This starts the changed code. Your saved expectations and runs remain in .zta/. If a stale-import error appears, use this same restart sequence; do not delete progress or reinstall packages.
